

# Retreat Resources in GitHub

Version 1.0

## Introduction

To centralize the resources for Retreat developments, Github is a public access for the general repository control management.

Advantages are to use the Github facility for:

1. Members in the Retreat developments are able to access everywhere and anytime.
2. Repository branching is to allow multiple phase developments at the same time.

## GitHub Setup

A Github profile "retreat-dev" is created to hold the retreat development repositories. The profile "retreat-dev" login and access information is available at:

Host:

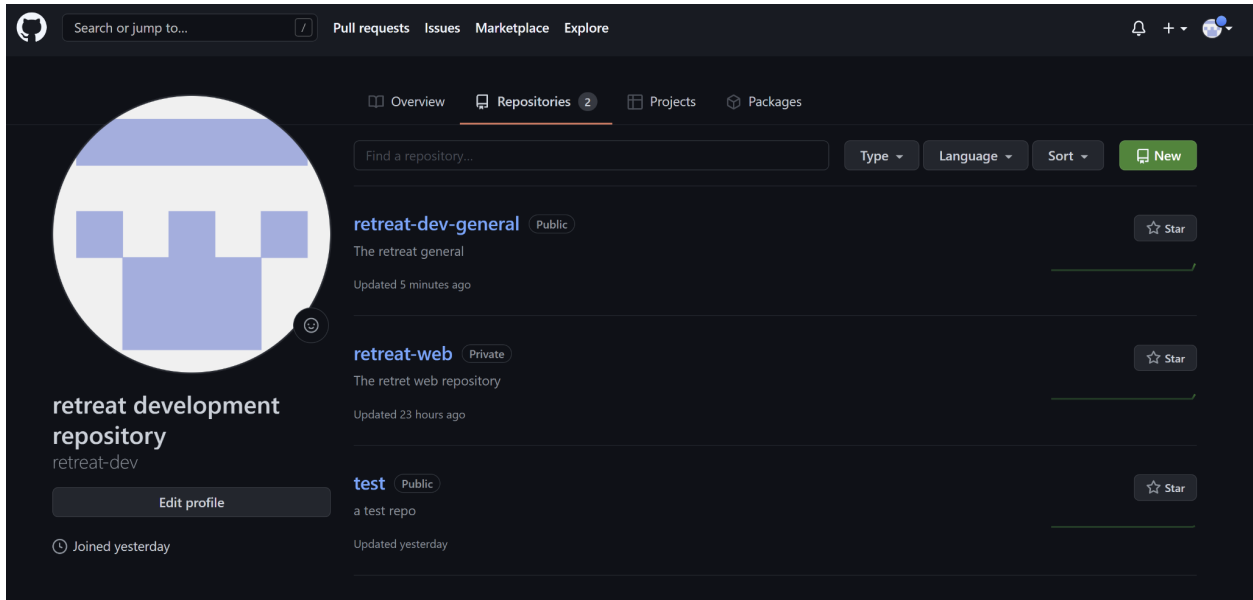

retreat-dev.dyndns.info:2222

File:

/home/ikeeper/access\_github\_retreat-dev.txt

## Repositories

Currently, there are three repositories created under the profile "retreat-dev":

## Repository: test

It is a public testing/playground repository for trying/testing the Github features in order to apply to the specified repositories for.

## Repository: retreat-dev-genera

A public retreat development repository for hosting the general retreat development documentations etc. This repository is not for the development scripting or source codes due to the public access.

## Repository: retreat-web

A private retreat development repository for sourcing the scripting and source codes.
